Color wheel definition in graphic design

The following established steps in the graphic design process can help you achieve the best results. As with most endeavors, organizing your approach and staying focused can help your most effective design emerge. Typically, graphic designers move through some common phases in each new project: Collecting information about the project. Brainstorming. Produce preliminary sketches. Work with the client through several rounds of changes. Put on the latest details. Here's a deeper look at each of these steps. As you follow these steps, be sure to complete each one before moving on to the next one. Each step depends on the information you get from it before it. Working for a client is a collaborative process that can easily go off the rails without a plan. Michael H/ Getty Images Knowledge is power. Before you do anything else, you need to know exactly what your client needs, the breadth of the job and payment details (how much, when and how). As you approach a new job, set up a meeting and ask questions about the scope of the work. These should include: Who is the audience? What's the message? How many pages will the piece entail? What are the dimensions? What is the budget? What's the deadline? Can the customer give examples of designs they like? Is there an existing business brand that needs to be matched? Will the piece be strictly printed, digital or both? Take detailed notes so you can refer to them throughout the design process. Many designers prefer to conduct this phase by email, so they have a paper trail both parties can refer back to. This helps prevent confusion and conflict. Using the information collected in the meeting, you will be able to develop an overview of the content and goal of the project. For a website, including all the major parts and content for each. Include dimensions and technical specifications for printing or webwork as well. Present this overview to your client and request any changes. Once you've come to terms with the creative aspects of the project, it's time to move on to the business aspects. This should include business details of the project: fee structure (flat fee vs. hour), milestones, deadlines, responsibilities (both client and designer), project delivery, kill fees, etc. The exact parameters of the project are especially important to refine to prevent scope creep - the tendency for projects to expand beyond the original outline and budget. For example, a client might request an additional page for a website or a custom illustration for a brochure. specify how add-ons like this will be handled so that you get paid for all your work and are allocated enough time to complete it. Have your client sign this proposal so that it becomes your contract. Use one of the many design contracts available online as a starting point. Think of creative solutions for your project. You can use the client's examples of favorite work that but your goal should be to come up something new and different that will stand out from the rest (unless, of course, the client specifically asks that the design fit into a larger body of safety). Here are some ways to make the creative juices flow: Brainstorm: Come along with a group and throw ideas without judging yet. Visit a museum: Get inspired by the originals. Read a book: Something as seemingly insignificant as a color or shape in a graphic design book can trigger an entirely original idea. Take a walk: Get out and see the world; nature is the original source of inspiration. People-watching can generate a lot of ideas, too. Characters: Even if you don't draw professionally, doodle some ideas on a page. It's time to give some structure to your project. Before you move into an application like Illustrator or InDesign, create some simple hand-drawn sketches of the play layout. Showing your client basic ideas before spending too much time on design is a good way to find out if you're heading in the right direction. Quick sketches of logo concepts, line drawings of layouts showing where items will be placed on the side, a quick handmade version of a package design etc. can generate feedback from the customer that is so important for nailing down a direction you both agree on. For web design, wireframes are a great way to start. Now that you've done your research, finished your content and gained approval on some sketches, you can move on to the actual design phases. Although you can knock out the final design in one shot, it is best to present your client with at least two versions. This offers options and allows you to combine the client's favorite items from each. Enter in the proposal/contract exactly how many unique versions you want to give. Too many options will lead to unnecessary work and can overwhelm the client, which can frustrate you in the end. Ideally limit this round to two or three original designs. Be sure to keep the versions or ideas you choose not to present at that point (including the ones you might not even like). You never know when they will benefit future projects. Let the customer know that you encourage mixing and matching the designs you provide. They may like the background color of one design and the font choices on another. From their suggestions, you can present the second round of design. Don't be afraid to give your opinion on what looks best. After all, you are a designer, and the client pays you for your expertise. Even after this second round, you can usually expect a few more rounds of changes before reaching a final design. Remember: The design is not about you; your client pays you to translate the message into something tangible. Give your expert opinion, but don't let ego cloud your mission. Thank you for telling us!
